

Notes – October 7, 2025

Topic: Discussion on Experimental Results of RBGS_GMRES, BGS_GMRES and built-in GMRES

1. Overview of Experiment Setup

Parameter	Description
Solver	RBGS-GMRES, BGS-GMRES, GMRES(built-in)
Runs	1
Matrices Tested	A1, A2, A3, A4
Sketch Sizes	s = 1, 5, 10, 20
Metric	Relative residual, $\frac{\ A^*Qy - b\ }{\ b\ }$

2. Experimental Results by Matrix

2.1 Matrix A1 – Nonsymmetric matrix

Matrix info: (n = 2500, alpha = 0.5, lambda = logspace(0,-5,n).')

Sketch info: (m = 501, d = 2 * m)

Converge info: (ctol = 1e-8)

► Results for Step Sizes

relative residual

• s=1

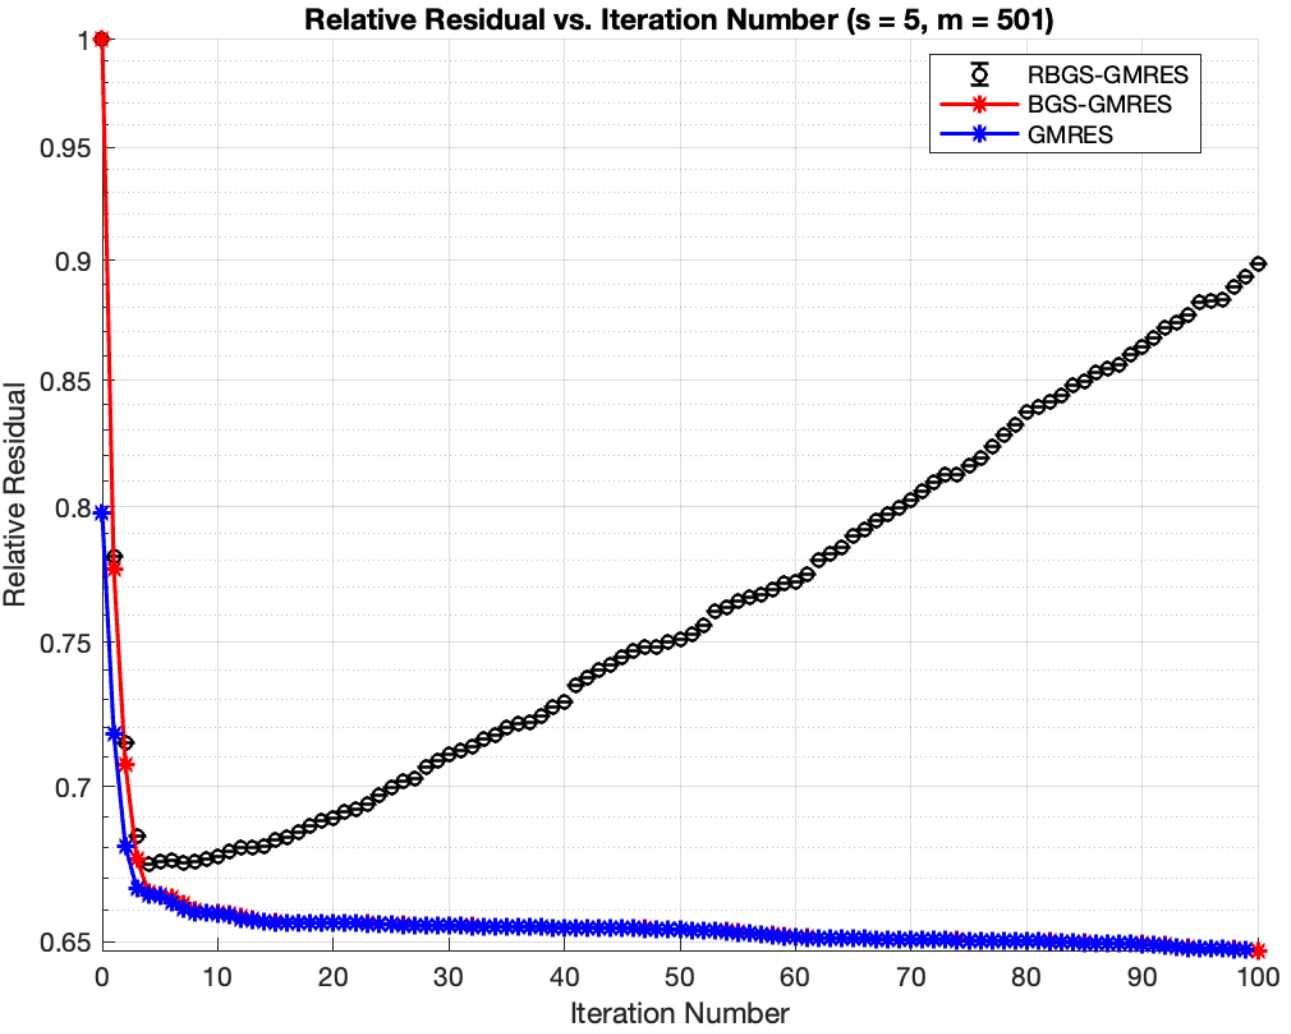

| residual after reorthogonalization

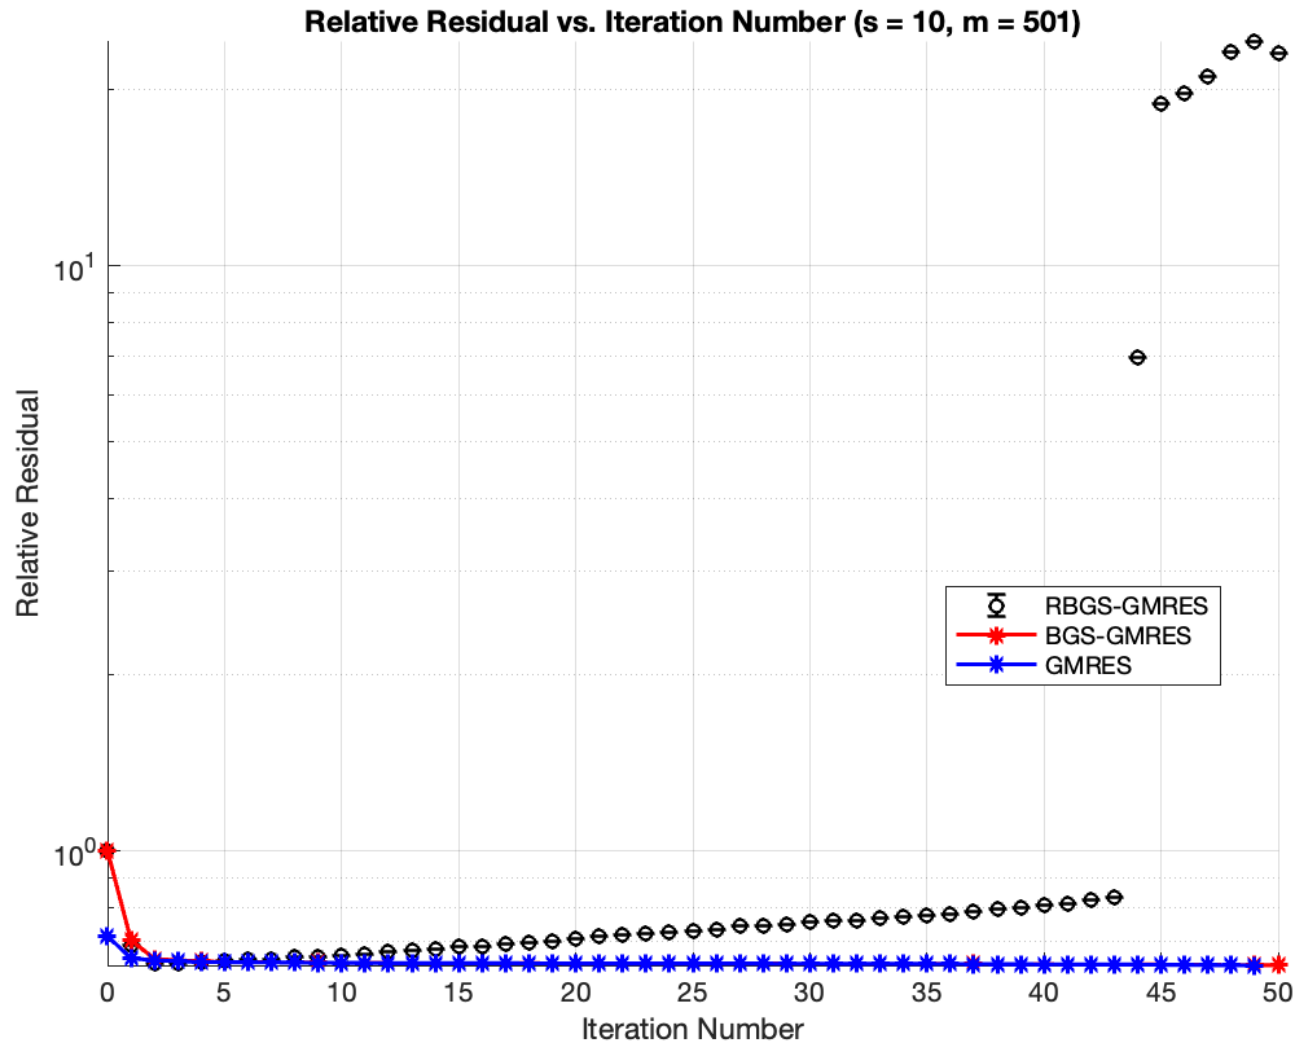

• s=5

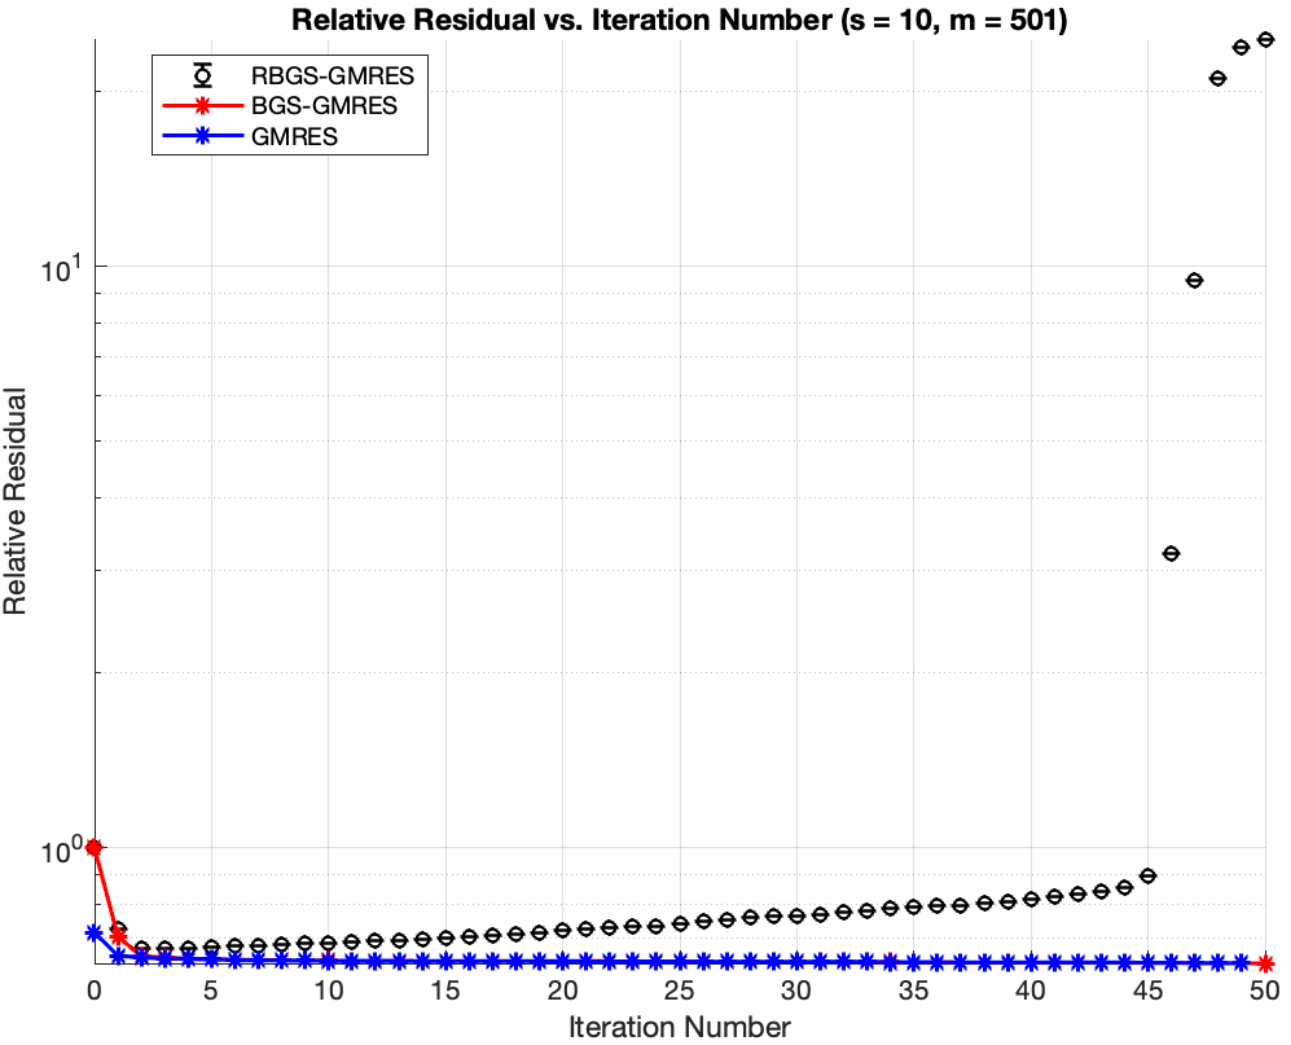

| esidual after reorthogonalization

• s=10

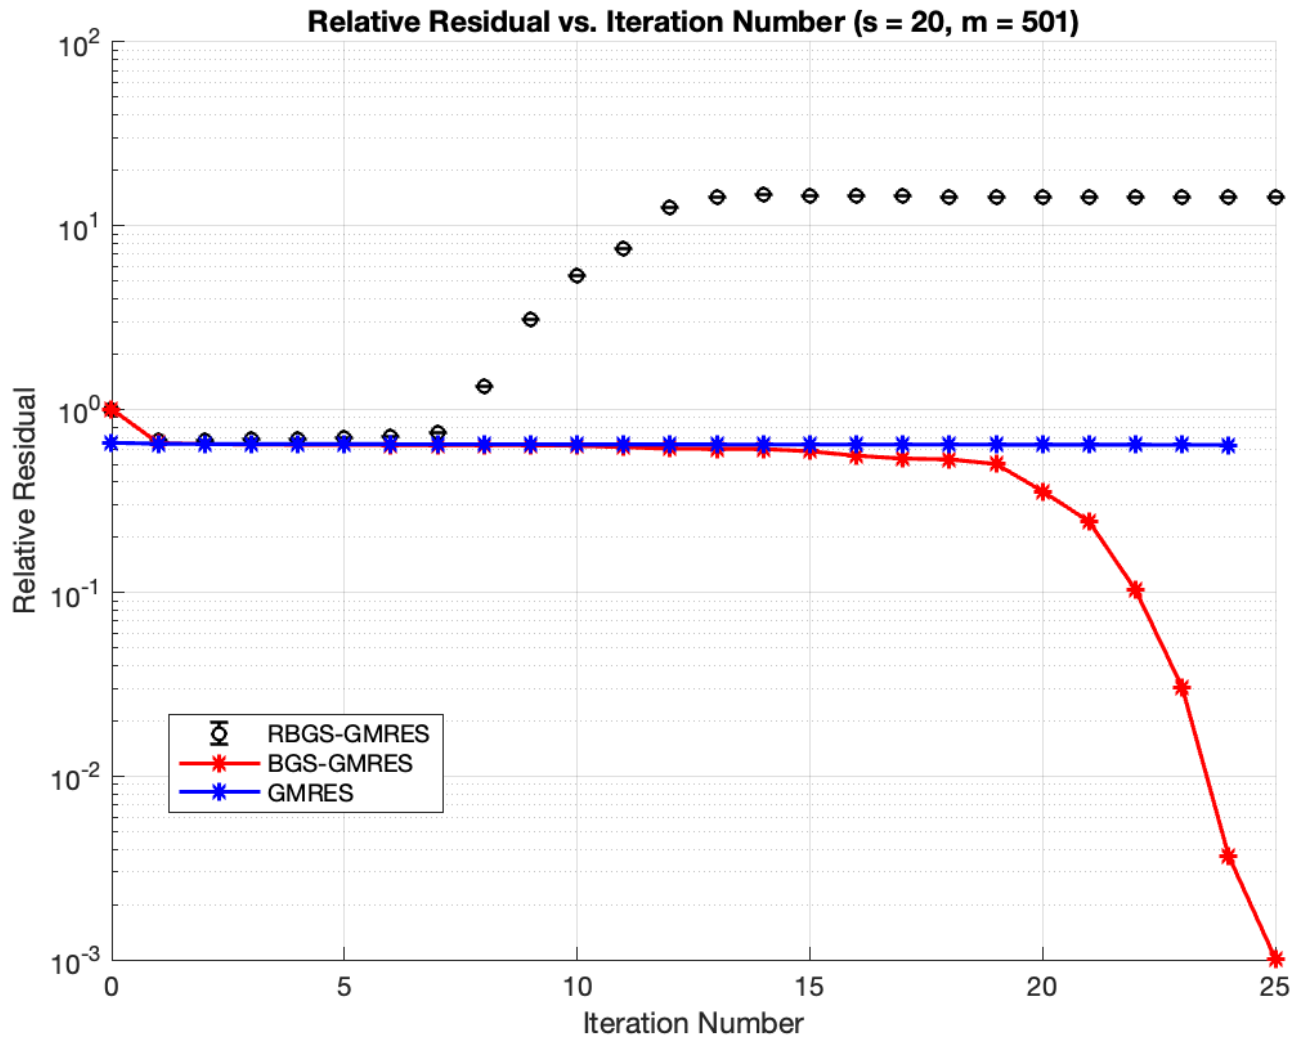

| residual after reorthogonalization

• s=20

[residual after reorthogonalization

Discussion:

- In the implementation, $m = 501$ is fixed
- When $s = 1$, BGS_GMRES and built-in GMRES coincide, showing that BGS_GMRES is fine in implementation
- RBGS_GMRES divergences in each case
- When s increases, BGS_GMRES begins to converge, and when $s = 20$, BGS even detects convergence after 340 steps
- It seems that when $s=10$, the residual does not conform to the theoretical condition $\|b - Ax_{\star}\| \leq \left(\frac{1+\epsilon}{1-\epsilon}\right)^{\frac{1}{2}} \|b - Ax_{\star}\|$. $\epsilon = \frac{1}{2}$.

Check Orthogonality

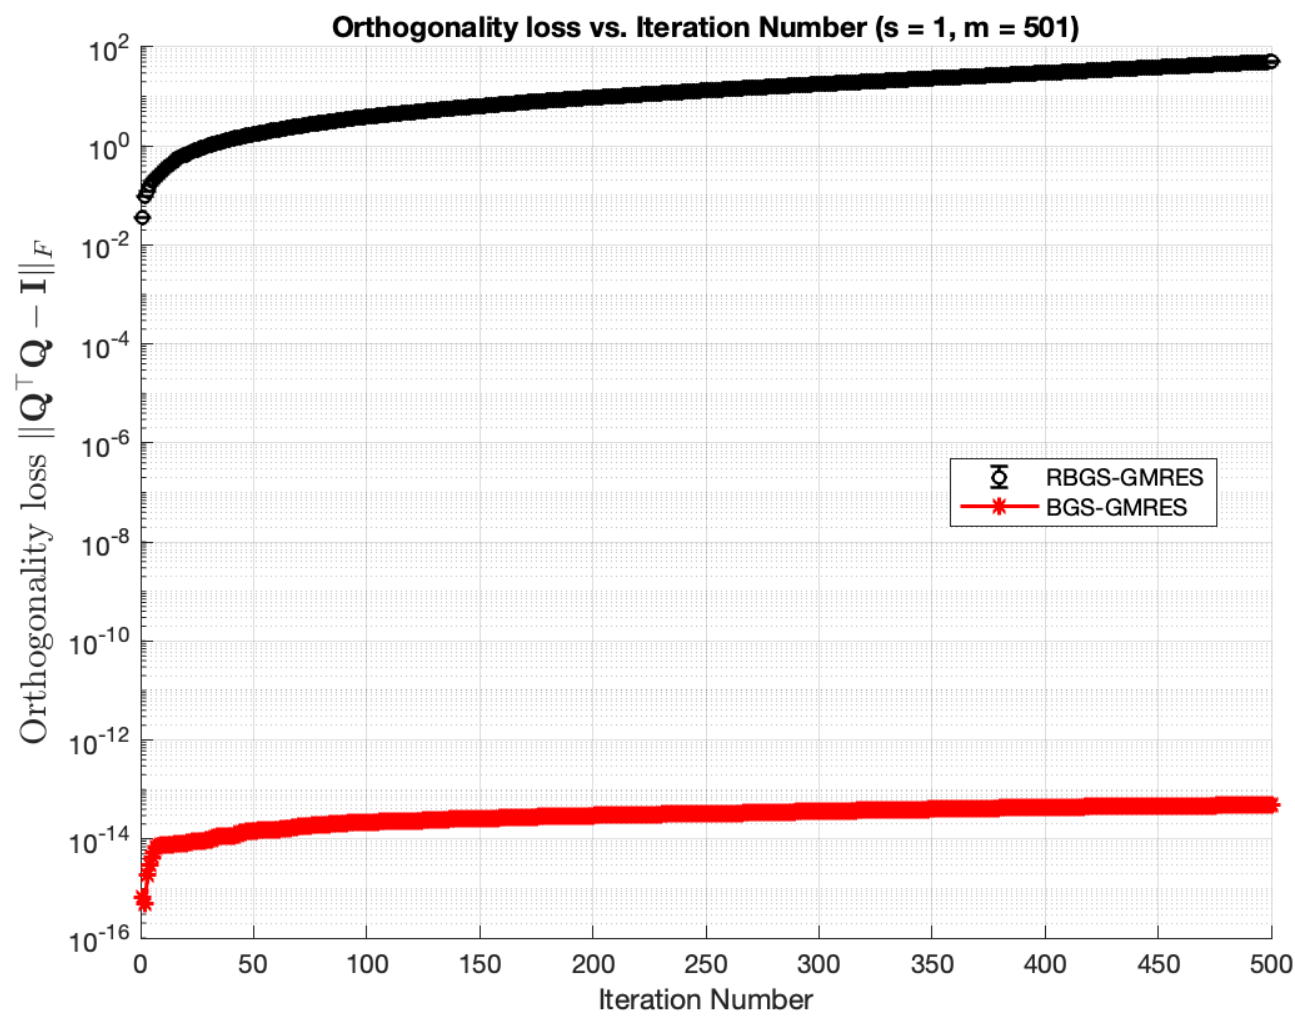

- When $s=1$,

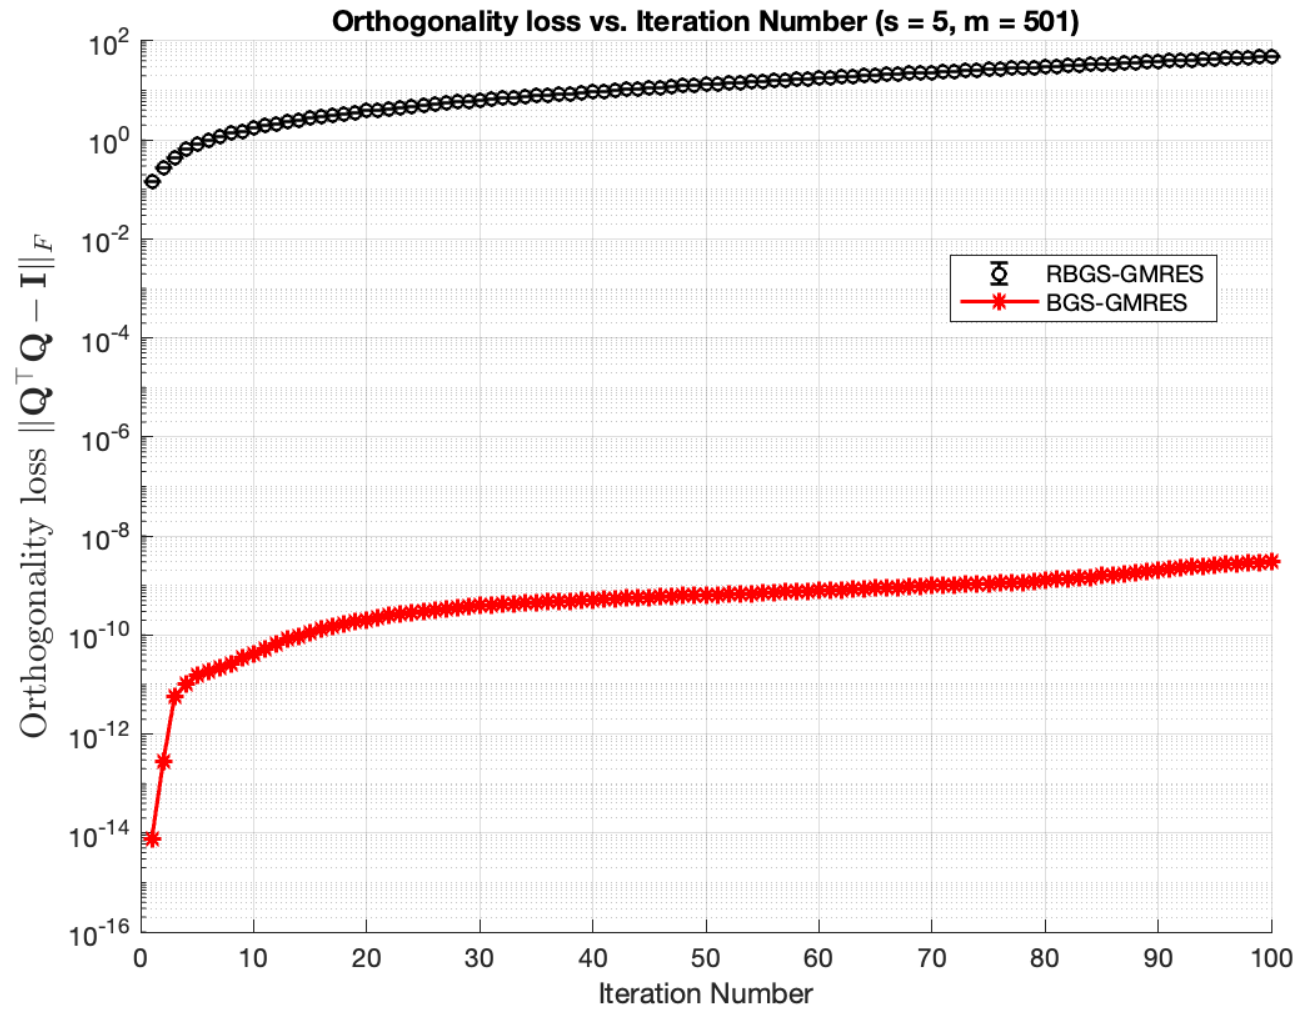

|With RBG reorthogonalization

|With both reorthogonalization

- When $s=5$,

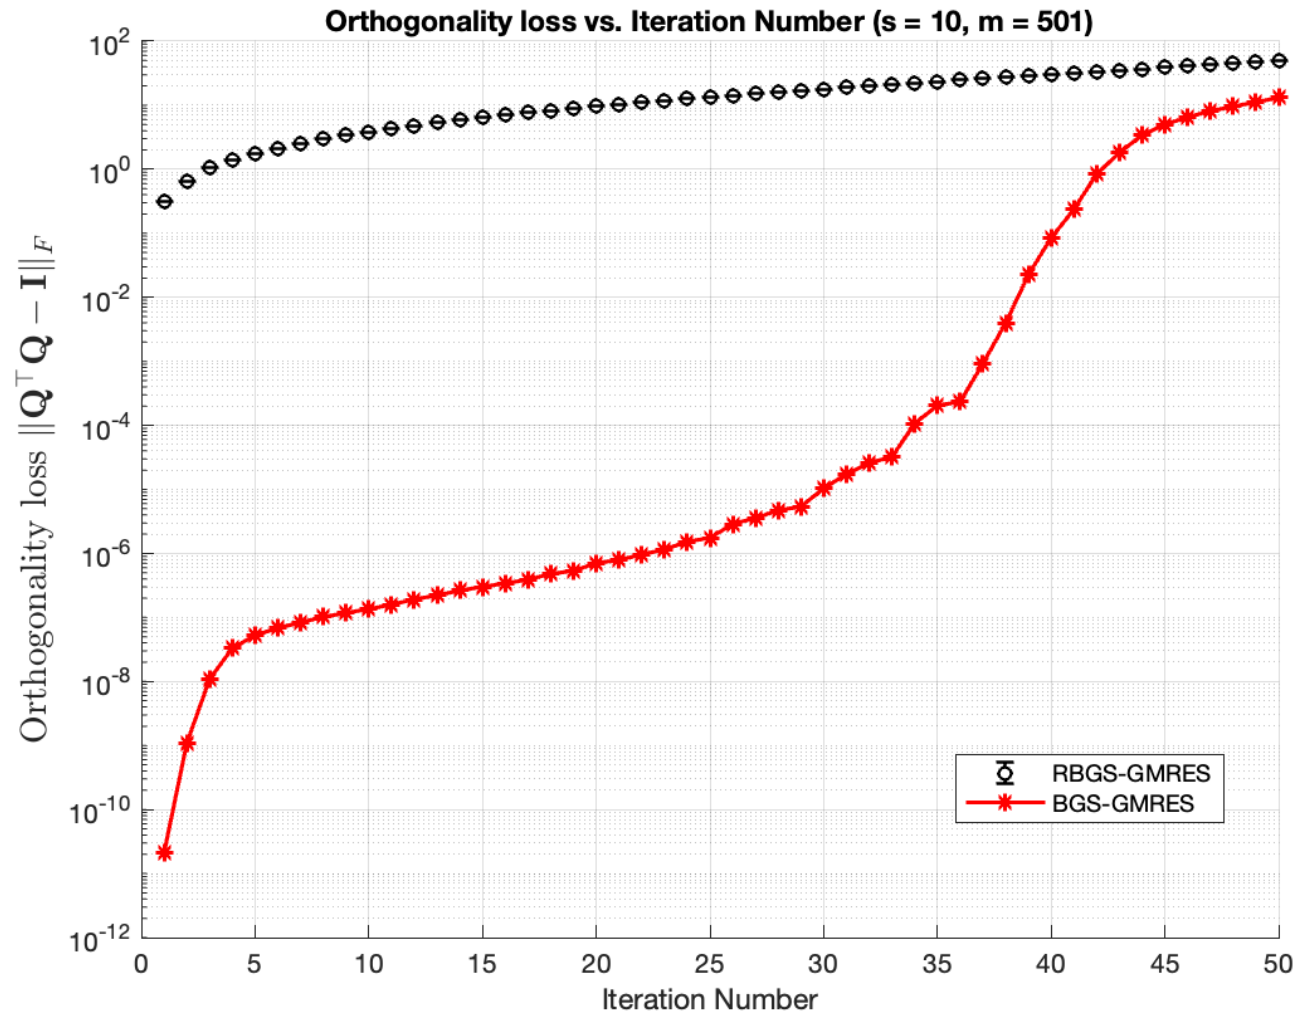

|With RBG reorthogonalization

|With both reorthogonalization

- When s=10,

|With RBG reorthogonalization

|With both reorthogonalization

- When $s=20$,

|With both reorthogonalization

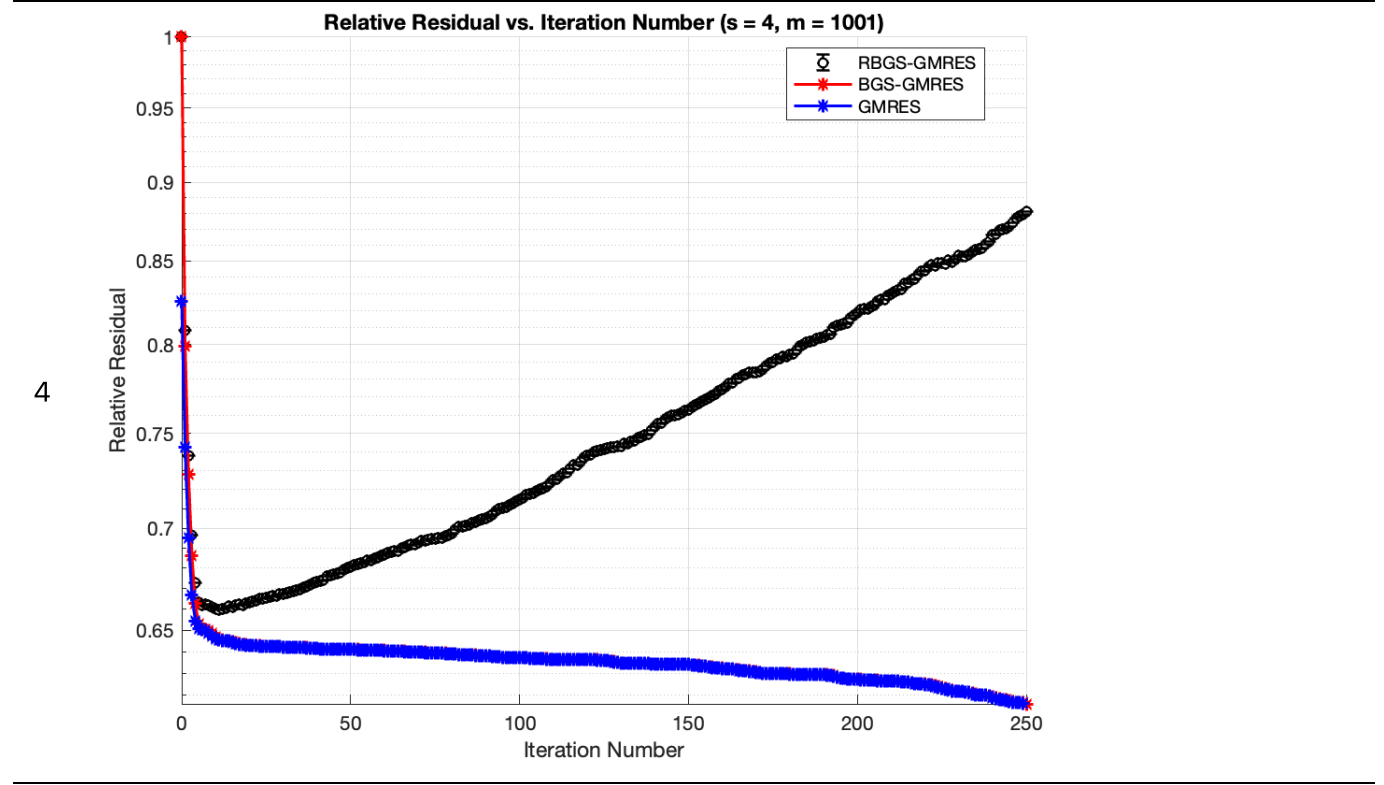

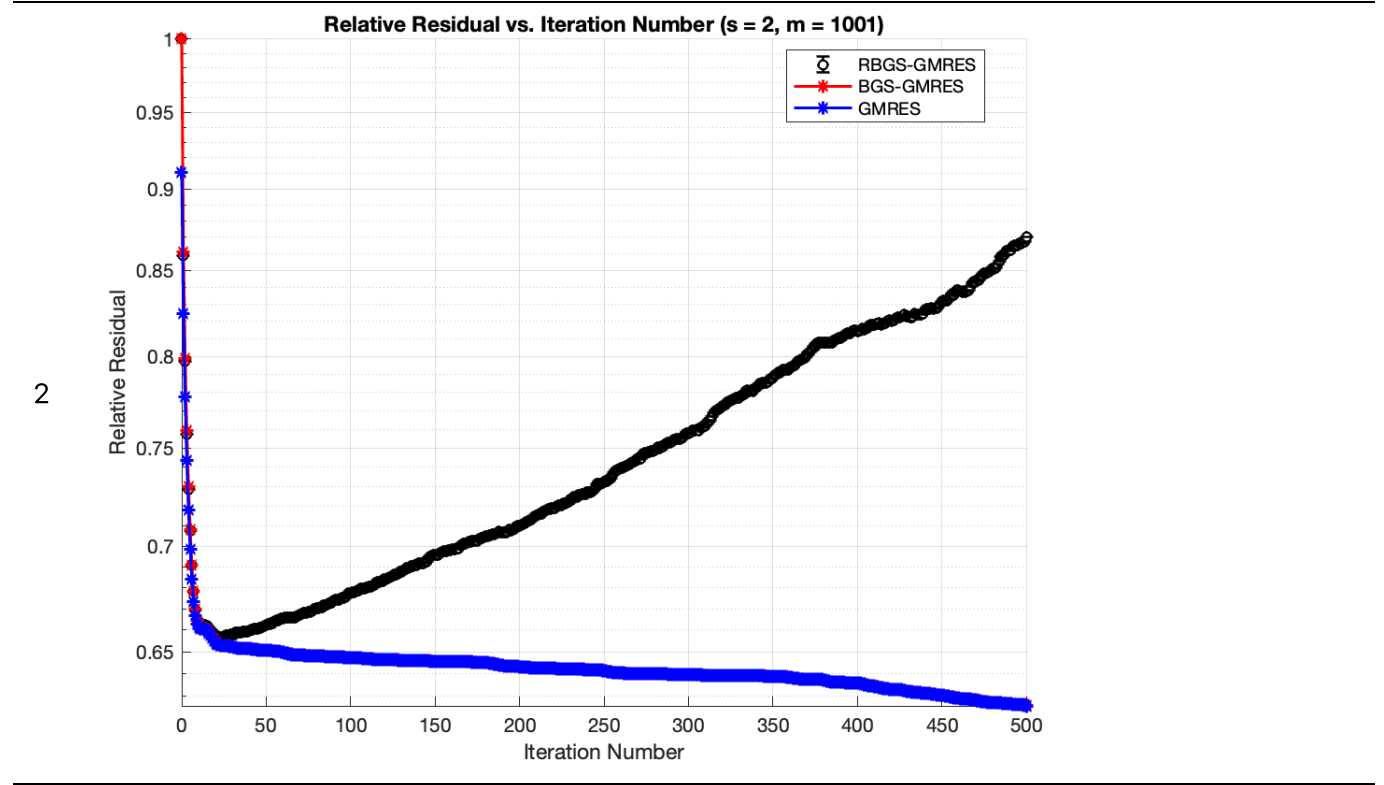

Discussion:

- After reorthogonalization, the θ -orthonormal Q generated by RBGS shows little improvement in orthogonality, although a slight enhancement can be observed in the relative residual. In contrast, the orthogonality improvement of BGS is more obvious

When m = 1000

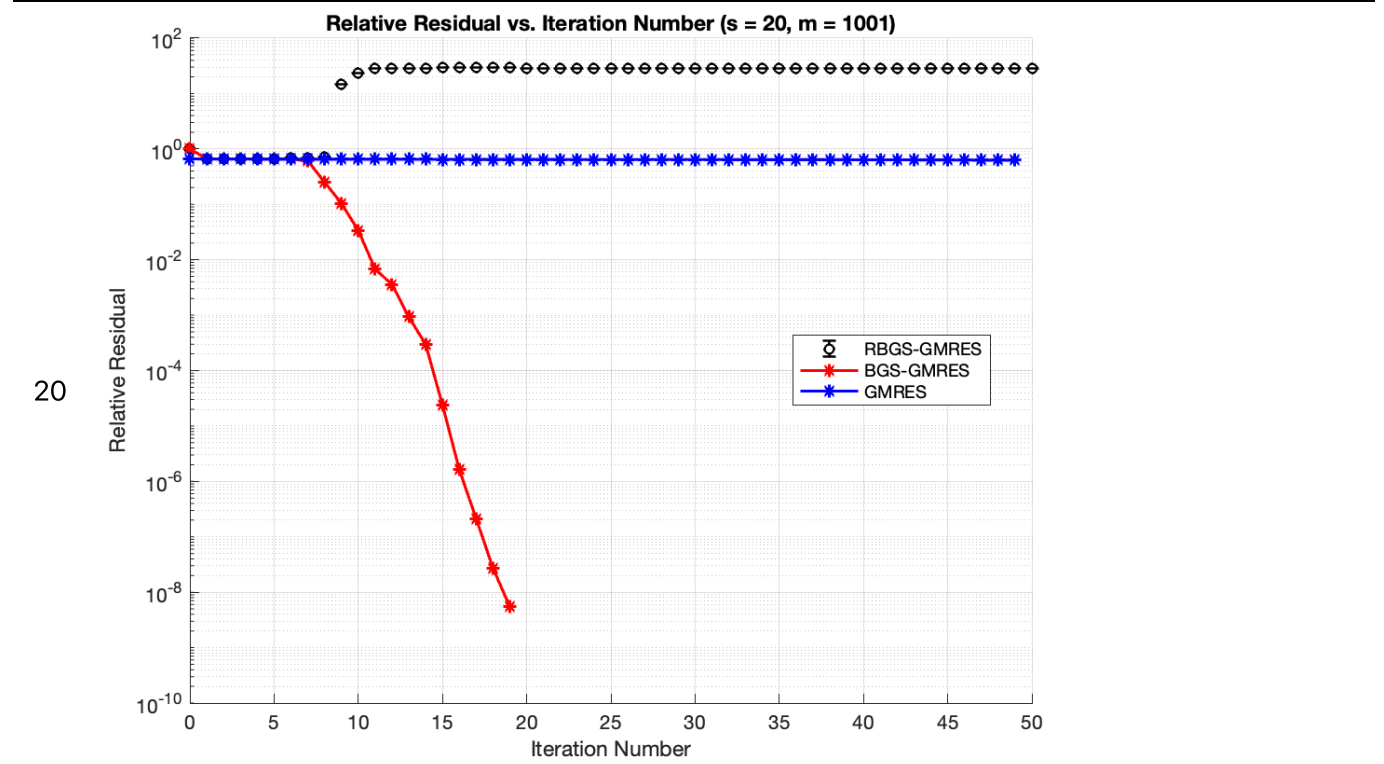

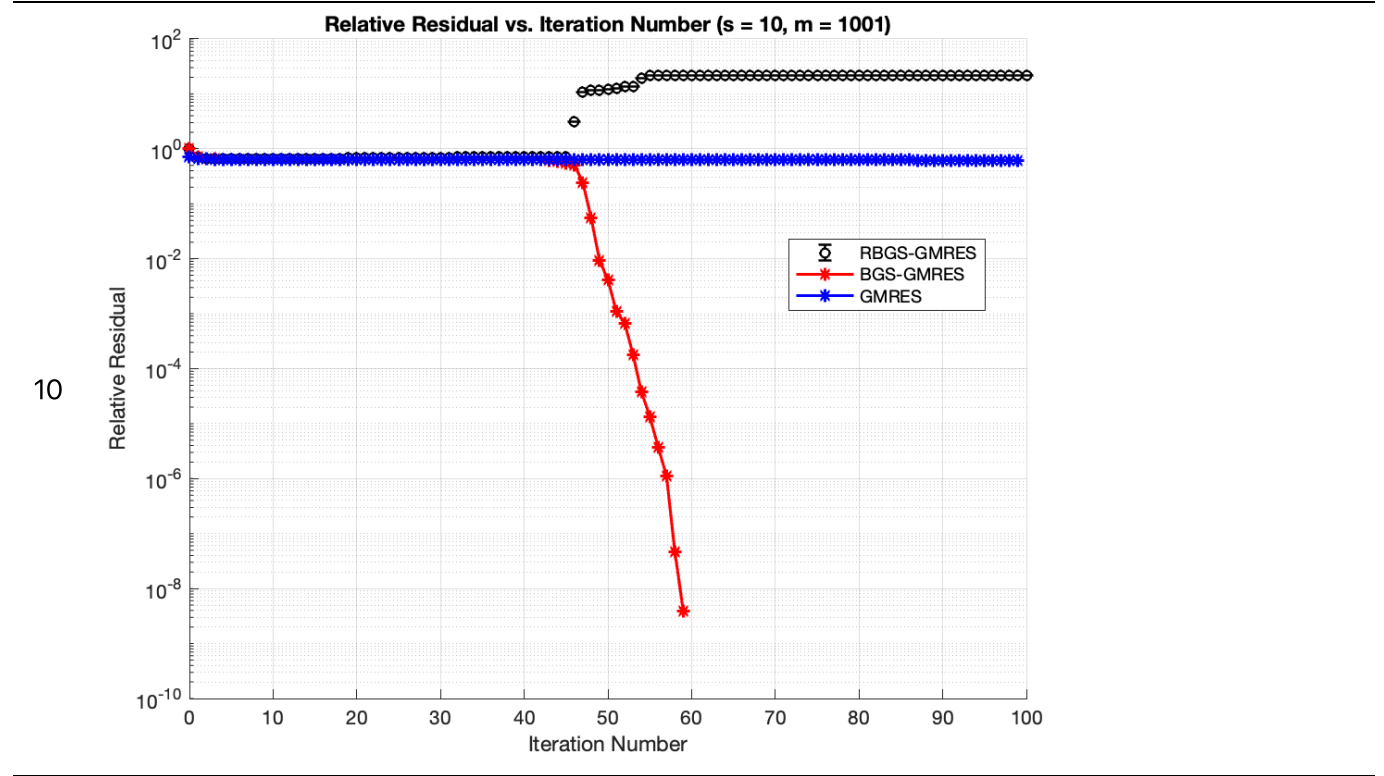

s	Relative Residual Plot	Iteration Count	Runtime (s)
---	------------------------	-----------------	-------------

s	Relative Residual Plot	Iteration Count	Runtime (s)
---	------------------------	-----------------	-------------

s	Relative Residual Plot	Iteration Count	Runtime (s)
---	------------------------	-----------------	-------------

Discussion:

- When s=8, BGS converged after 680 steps
- When s=10, BGS converged after 590 steps
- When s=20, BGS converged after 380 steps

2.2 Matrix A2 – Hermitian matrix

Matrix info: (n = 2500, alpha = 0, lambda = logspace(0,-5,n).')

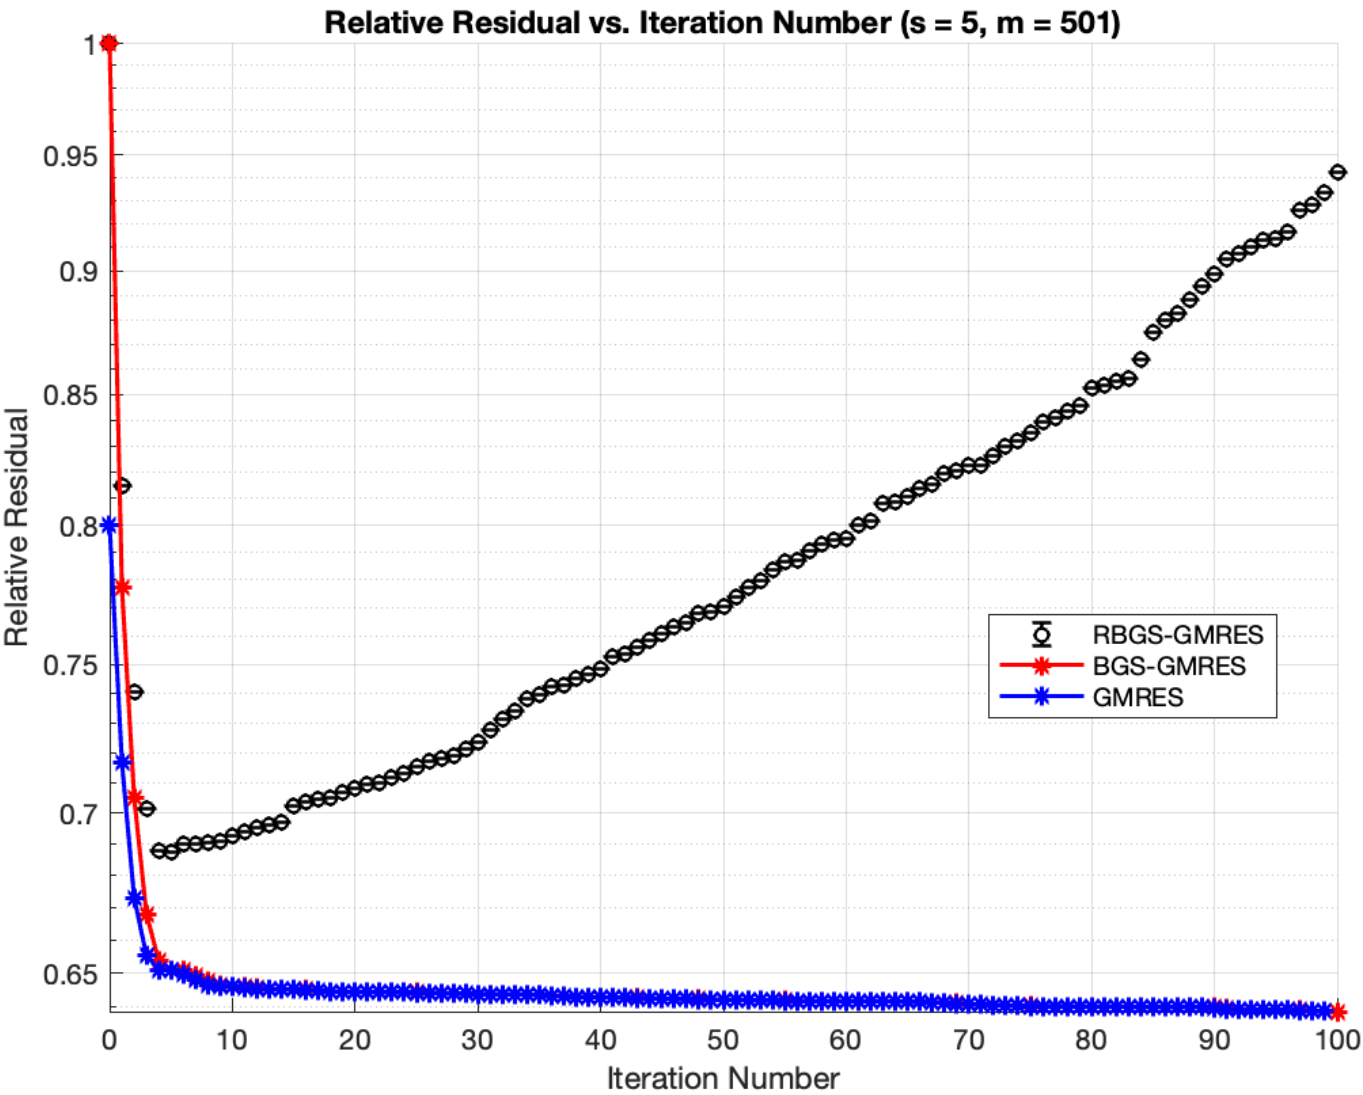

Sketch info: (m = 501, d = 2 * m)\

Converge info: (ctol = 1e-8)

► Results for Step Sizes

relative residual

-s=5,

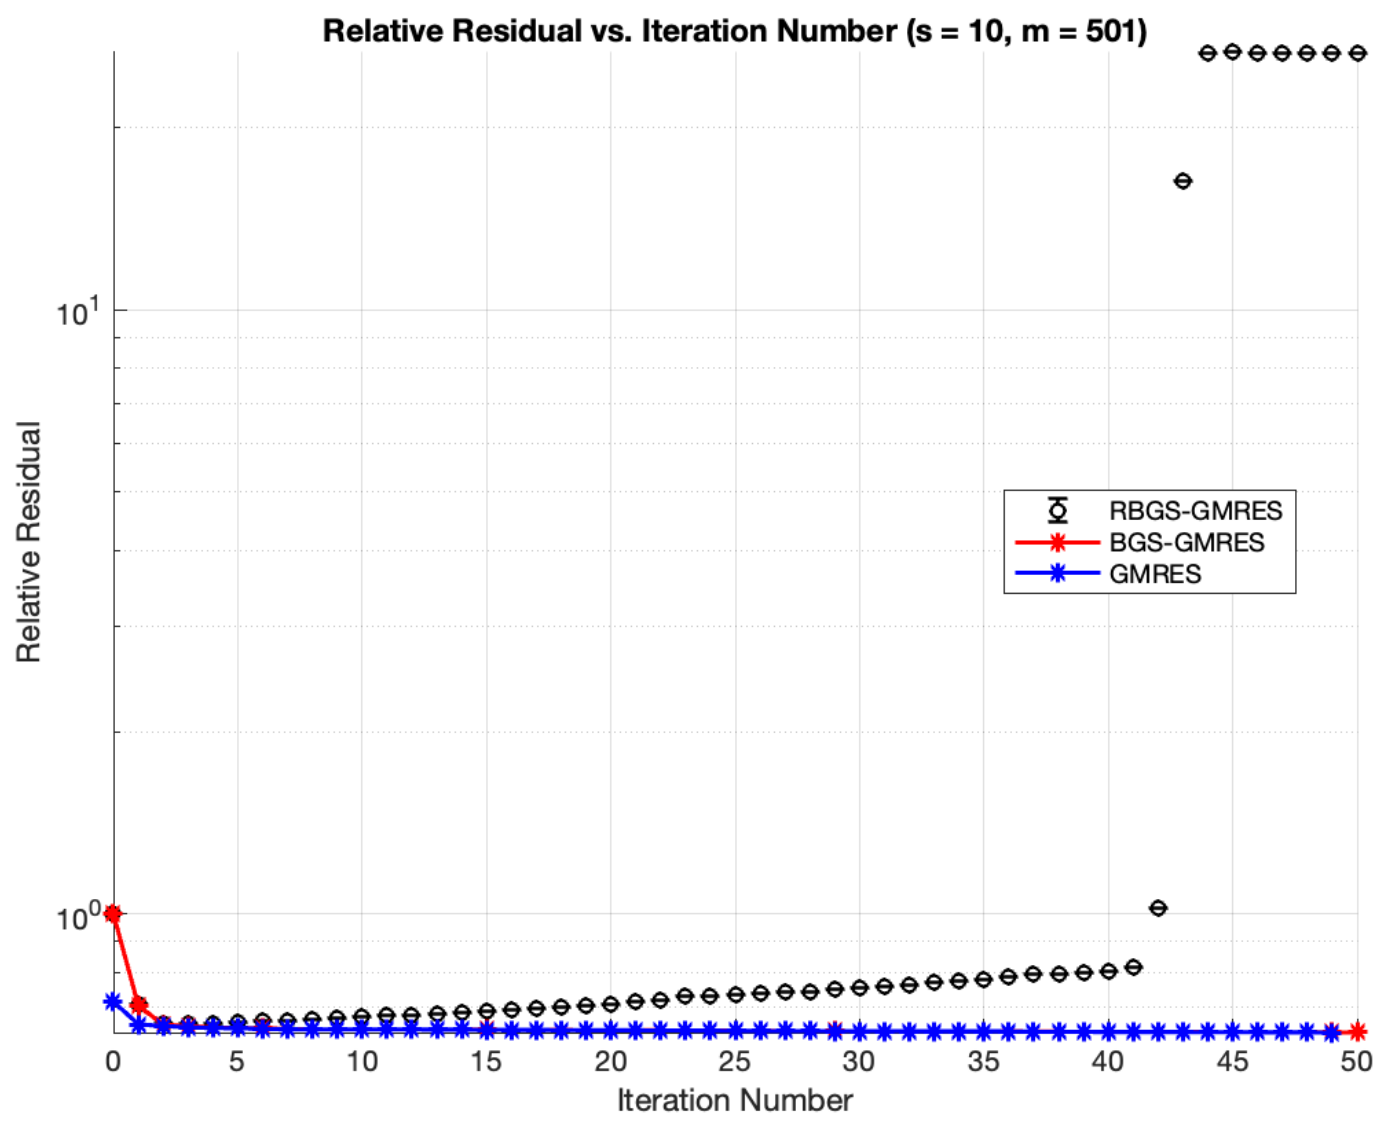

| residual after reorthogonalization

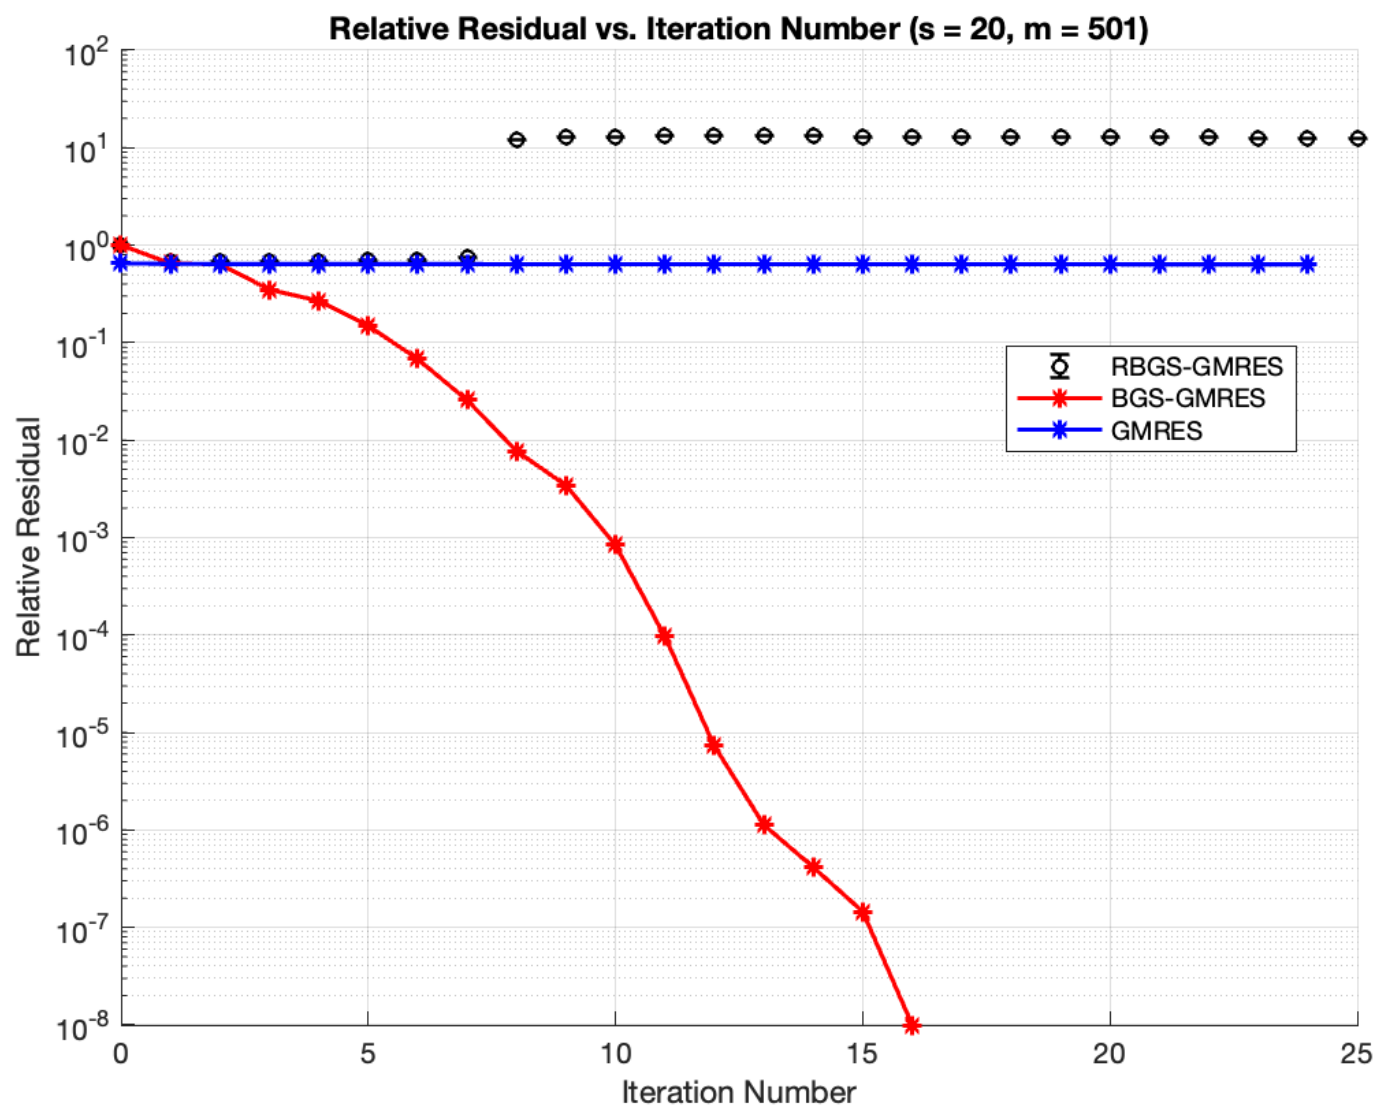

-s=10,

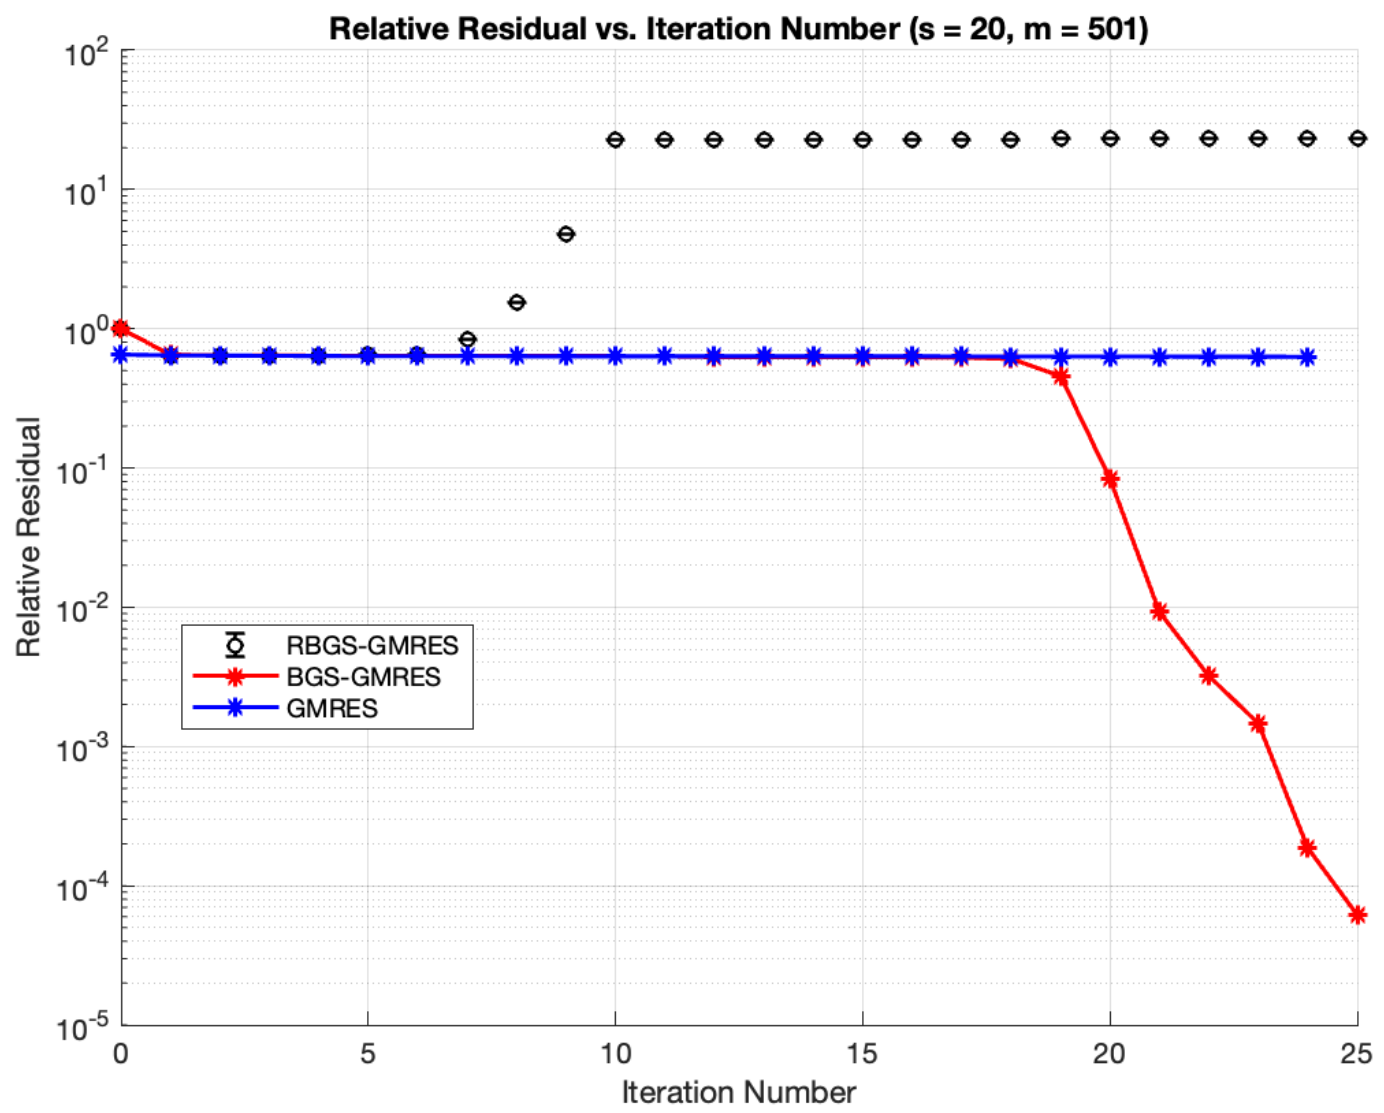

| residual after reorthogonalization

-s=20,

| residual after reorthogonalization

Discussion:

- When s=20, BGS converged after 320 steps

Check Orthogonality

- When $s=5$,

|With both reorthogonalization

- When $s=10$,

|With both reorthogonalization

- When $s=20$,

[With both reorthogonalization

Discussion:

2.3 Matrix A3 – matrix with smaller condition number

Matrix info: (n = 2500, alpha = 0.5, lambda = logspace(0,-1,n).')

Sketch info: (m = 501, d = 2 * m)\

Converge info: (ctol = 1e-8)

relative residual

-s=5,

| residual after reorthogonalization

-s=10,

| residual after reorthogonalization

-s=20,

| residual after reorthogonalization

Observation:

- When s=5/10, all the algorithms converge after 30 steps
- When s=20, BGS converged after 220 steps

Check Orthogonality

- When s=5,

[With both reorthogonalization

- When $s=10$,

[With both reorthogonalization

- When s=20,

[With both reorthogonalization
